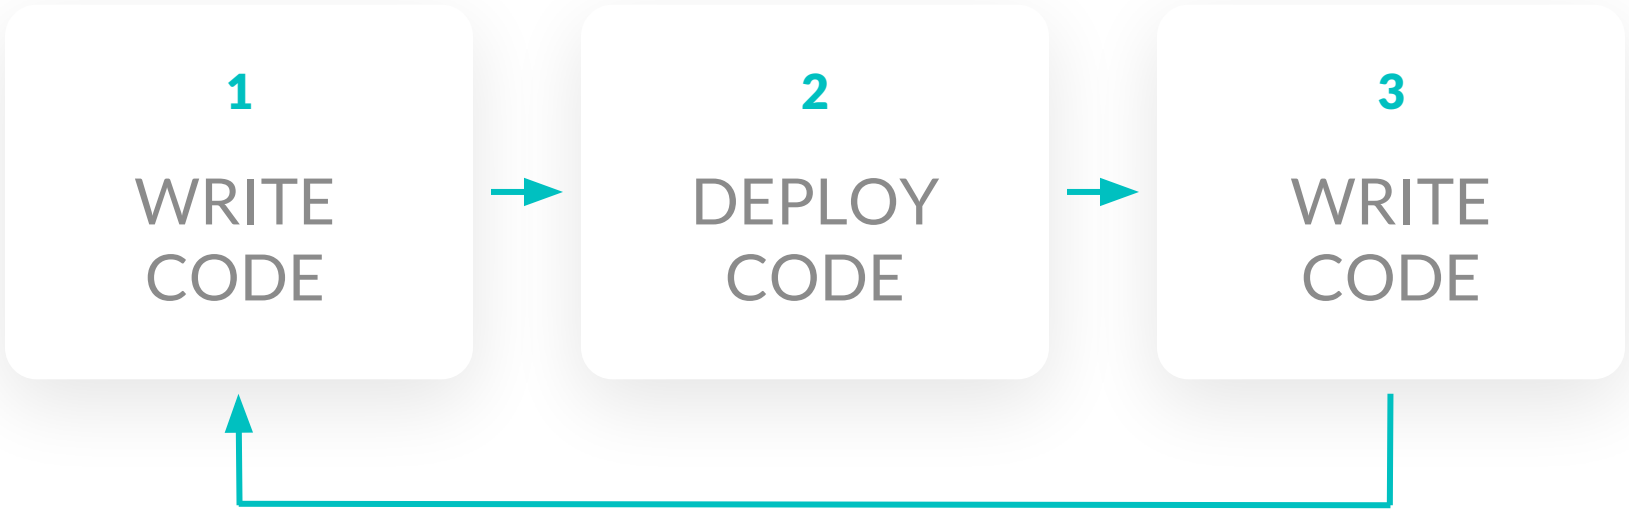
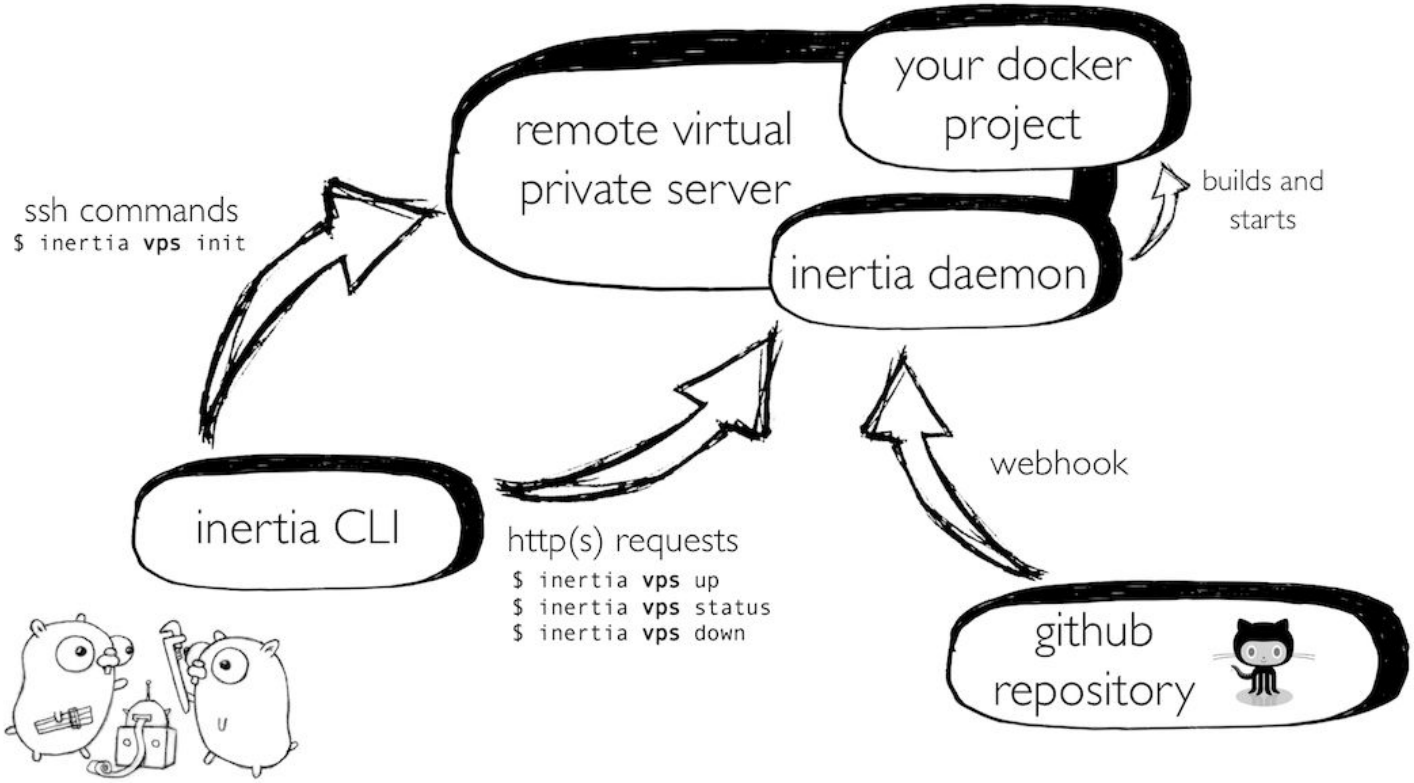
INERTIA

Simple, self-hosted continuous deployment

Continuous Deployment



How it works



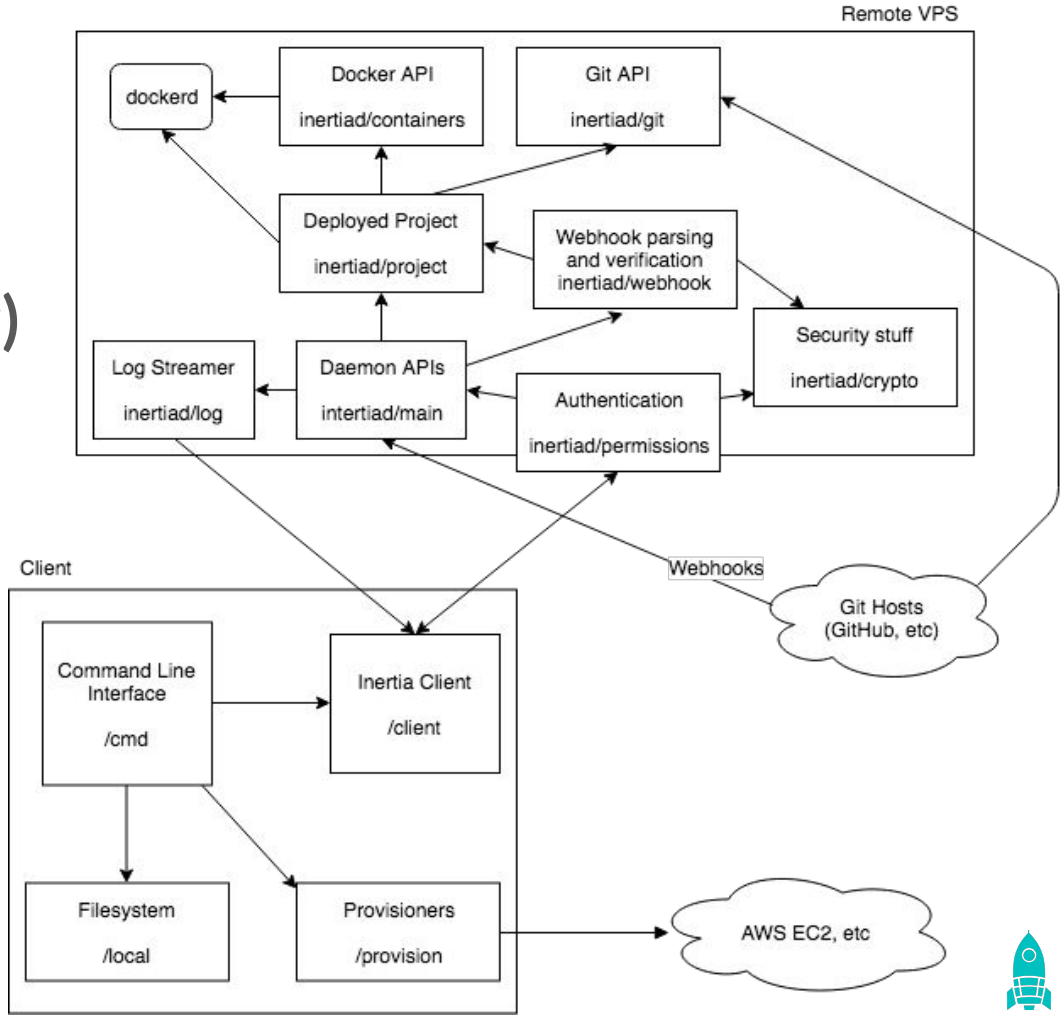
remote virtual private server
your docker project
inertia daemon
builds and starts
ssh commands
$ inertia vps init
inertia CLI
http(s) requests
$ inertia vps up
$ inertia vps status
$ inertia vps down
webhook
github repository

Code is hard

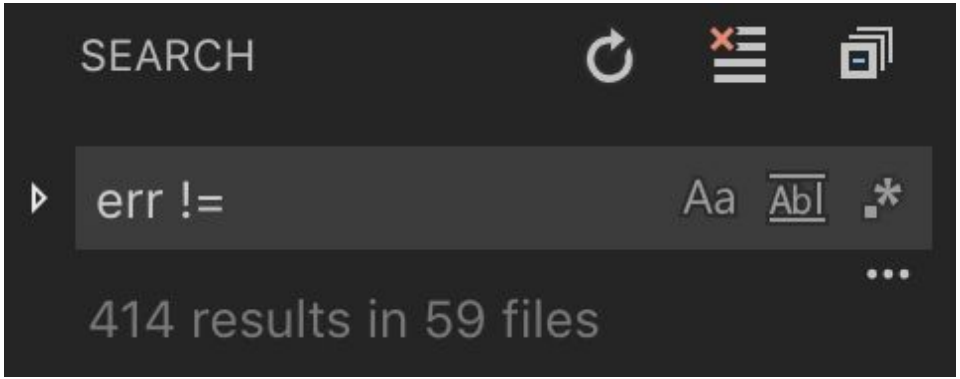
(but diagrams are harder)

Inertia today:

- **~13,000 lines of Golang** across ~36 packages
- **~1,500 lines of Javascript**
- ~1,200 commits
- ~2,300 Travis builds
- ~21 contributors



a golang meme

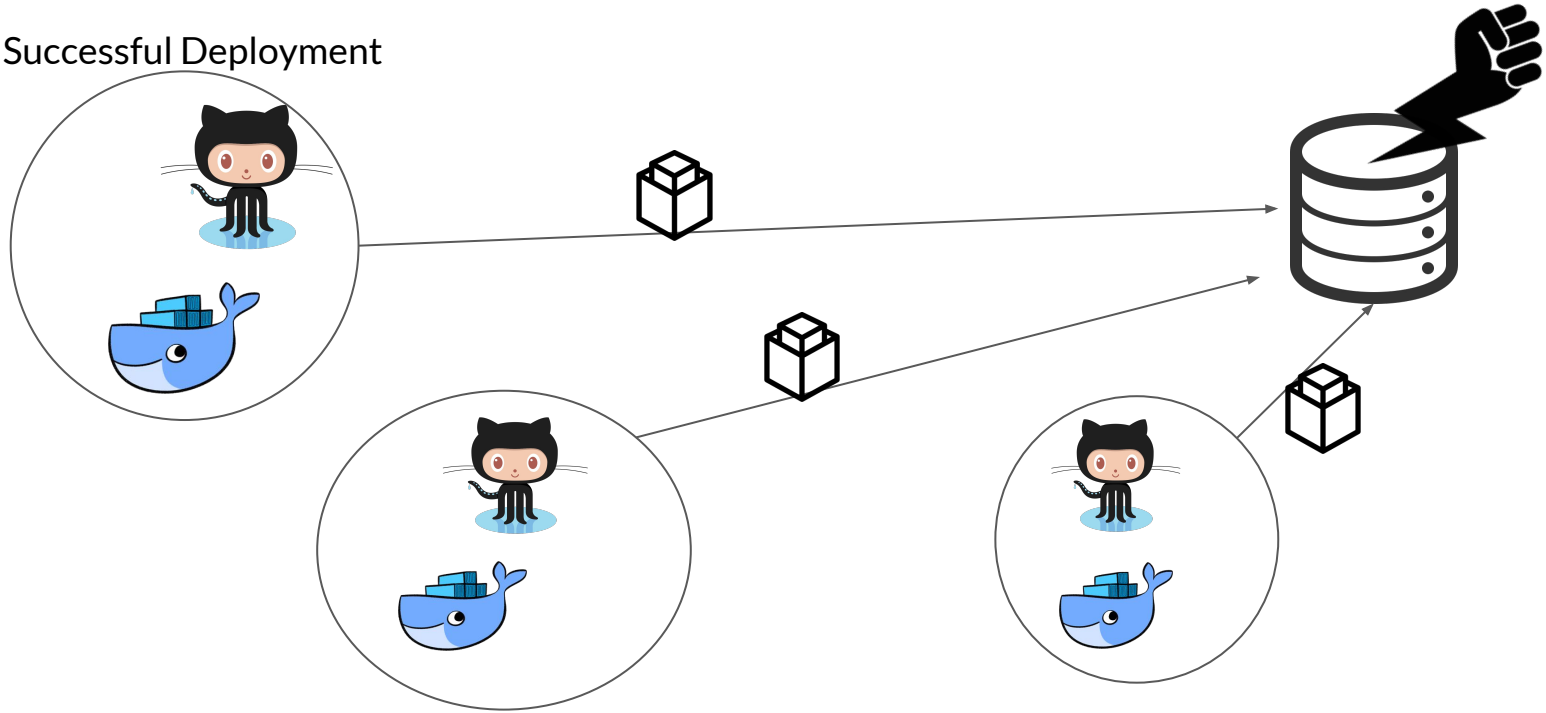


(~414 checks) * (~3 lines per err check) = ***~1,242 lines of err checks***

(414) * (~3 lines per er… …err checks

Seif - Project Deployment History

Successful Deployment



Next Steps

Failed Build

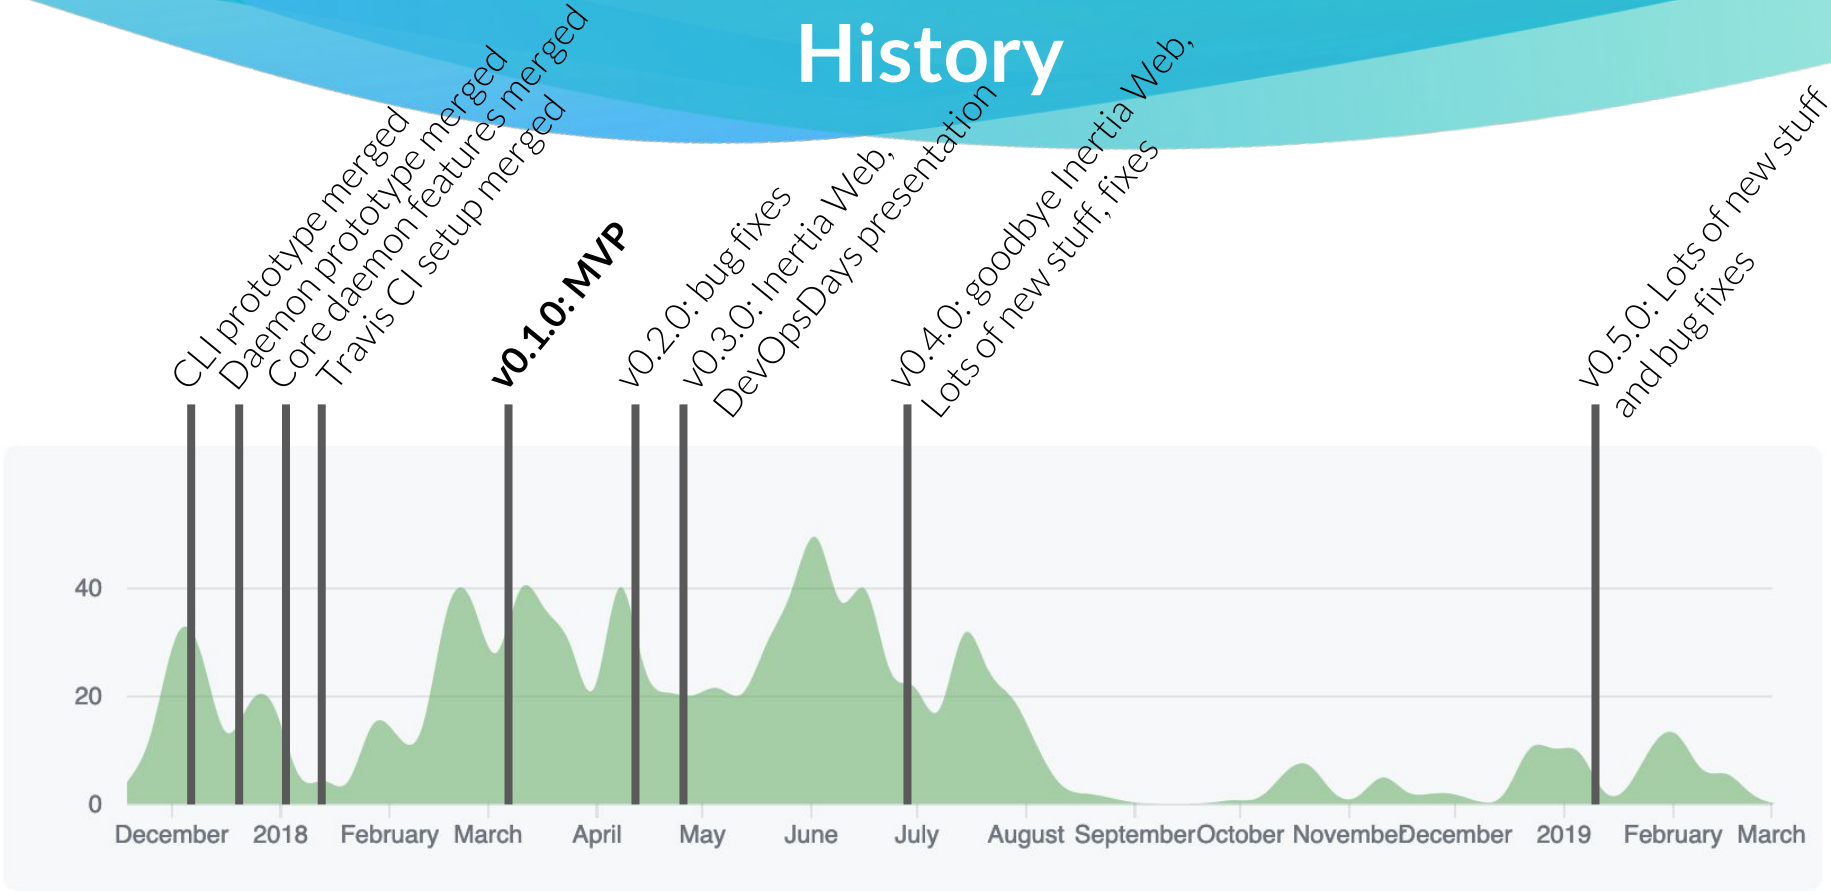
History

- Started in December 2017 (Chad, Jordan, Robert, Bruno)
- Wanted to address project deployment @ Launch Pad
  - Deployment is hard
  - Sporadic funding / free trials from cloud providers
  - Existing standalone tools are usually overkill
- Hacked out an MVP by March 2018 (v0.1.0)
  - MVP was not very good (aka it was very bad)

History



CLI prototype merged
Daemon prototype merged
Core daemon features merged
Travis CI setup merged
v0.1.0: MVP
v0.2.0: bug fixes
v0.3.0: Inertia Web, DevOpsDays presentation
v0.4.0: goodbye Inertia Web, Lots of new stuff, fixes
v0.5.0: Lots of new stuff and bug fixes

tl;dr shit takes time

don’t give up! focus on learning and experimenting

sometimes you do things wrong and that’s okay

be proud of what you’ve done!
